

New and Improved Features in ALIGNFACTORY

Please note: New and improved features may be added to a given version of AlignFactory while it is still in development. For example, if you had version **3.0.0.16057** before updating, some new or improved features may have been added to a subsequent build in the same version (e.g. **3.0.0.17037**). For this reason, new and improved features are listed in reverse chronological order.

3.1.0

- Addition of two new file matching engines: Misnomer and Terminotix. The Misnomer matching engine analyzes the contents of files so that they can be matched correctly even if they have completely different names. The Terminotix matching engine allows you to modify advanced configuration settings and displays the options **One marker per file** and **Extensions must match** in the interface.
- New XML bitext format enabling display in all major browsers: Chrome, Firefox and IE9+ / Edge
- Alignment of comments in MS Word documents
- Increased alignment speed
- Field facilitating the inclusion or exclusion of folders in a given file path
- Option to decide whether or not to apply language markers to folders
- Option to isolate a specific language marker if the file name contains multiple markers
- New option prioritizing the alignment of files with the same extensions, meaning that a source Word document will not be paired with a target PDF document if a target Word document exists

3.0.0

- Introduction of the **Web Crawler**, which allows you to automatically download and align pages or files from a given website
- Introduction of a **UTF-8 encoding** option to avoid character recognition errors in the case of HTML files encoded in UTF-8 that do not contain an encoding indication
